

Visibility Knowledge Control

With loop+ at the end of every day you're able to see how much time your child has spent in their wheelchair, when they are most active and even what times of day they shifted away from their ideal position.

Co-designed with parents and seating specialists to deliver meaningful and motivating impact in your child's life.

Easy To Use And Set Up

The sensor pad fits under the cushion and collects data continuously and effortlessly in the background as your child goes about their day.

Replay Your Child's Day

Choose any time of the day where you see something interesting and replay your child's pressure distribution as if in realtime! Save these events for initial discussions with your child or their therapists.

Keeping Track

We've included a handy logging tool so you can keep track of appointments, therapy, pain and achievements. Add photos and filter events for discussion with your child's care team.

Personalised Reports

Our baseline report highlights key metrics relating to your child's wheelchair usage to encourage data driven conversations with clinicians. Reports can be utilised to support funding reviews, equipment requests or track behaviours.
