

Visibility Knowledge Control

With loop+ at the end of every day you're able to see how much time your client has spent in their wheelchair, when they are most active and even what times of day they shifted away from their ideal position.

Co-designed with Wheelchair users and seating specialists to deliver meaningful and motivating impact in your clients life.

Easy To Use And Set Up

The sensor pad fits under the cushion and collects data continuously and effortlessly in the background as they go about their day.

Replay Your Day

We've included a handy logging tool so they can keep track of appointments, therapy, pain and achievements. Add photos and filter events for discussion with their care team.

Keeping Track

Choose any time of the day where you see something interesting and replay pressure distribution as if in realtime! Your client can save these events for later discussions.

Personalised Reports

Our baseline report highlights key metrics relating to wheelchair usage to encourage data driven conversations with clinicians. Reports can be utilised to support funding reviews, equipment requests or track behaviours
